PRODUCT DESCRIPTION

## optibelt ZR TIMING BELTS

ISO 5296

## Structure

## Top layer

A flexible belt backing embeds the tension element and supports it against the reverse idlers. The top layer consists of a flexible high quality chloroprene compound. This protects the tension cord from oil, humidity, friction and wear and tear.
This top layer has some inherent resistance to mineral oils, but not to vegetable oils and water soluble cooling and cutting oils.

## Tension cord

The tension cord is a continuous, spirally wound glass fibre. This material has a high tensile strength and is extremely flexible. The low-stretch properties of the tension cord ensure that the pitch of the belt corresponds to the pitch of the pulley - even when under strain.

## Teeth

The teeth are made of a shear and wear resistant rubber compound vulcanised to form a unit with the belt back. The shape and arrangement of the teeth are such that the pulley engages the belt teeth precisely and with minimum friction. As long as six teeth or more are in mesh on the small pulley, the complete capacity of the timing belt can be used without any deduction.

## Fabric

In order to obtain a low level of wear on the running surfaces as well as achieving a high level of tooth shear strength, a tough, wear resistant fabric is applied to the outer tooth surface.

## Tooth pitch, designations

optibelt ZR timing belts are manufactured according to ISO 5296, timing belt pulleys according to ISO 5294. Both come in six standard profiles.
Due to the American origin of the timing belt profile, the length unit is "in" for inch. The width/length codes have thus been derived from the imperial (inch) measurements of widths and lengths.

Table 1: Belt profiles and tooth pitch

| Profile | Tooth pitch † |  |
| :---: | :---: | :---: |
|  | [mm] | [inches] |
| MXL | 2.032 | 0.080 or $2 / 25$ |
| XL | 5.080 | 0.200 or $1 / 5$ |
| L | 9.525 | 0.375 or $3 / 8$ |
| H | 12.700 | 0.500 or $1 / 2$ |
| XH | 22.225 | 0.875 or $7 / 8$ |
| XXH | 31.750 | 1.250 or $11 / 4$ |

Tooth pitch is the distance from the centre of one tooth to the centre of the next measured at the pitch line, which corresponds with the level of the tension cord. The pitch or datum diameter of the pulley is a theoretical dimension which lies outside the outer diameter.
